

L.T. (Light TraX)

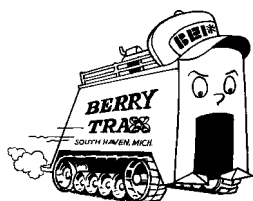

BEI announces a new addition to its self-propelled berry harvester line up, “**L.T.**”. **L.T.** (Light TraX) is the little brother of our larger Berry TraX harvester. **L.T.** uses a track rather than wheels to propel the harvester through the field. This means less ground compaction and above that it means that the machine can go where most other machines can't. BEI kept the famous harvest features of it's full size harvester, but at savings of thousands less.

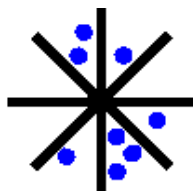

The harvesting system of **L.T.** uses a sway type picking system, 9” bucket conveyors, and horn style blowers. There is plenty of on-board lug storage both on the sides and on the upper platform.

L.T. has several other advantages. The machine's overall width is 8 ft 6 in, which means that it can be hauled down the road without permits. The machine weighs 8000 lbs which is significantly less than larger self-propelled machines. It also has 12” hydraulic lift for varying field conditions.

The harvester is powered by a 36 hp diesel engine that drives hydraulic pumps which turn the 12” wide by 84” long tracks. The machine is 8'6” wide by 15' long.
